AI Code Review — Options Evaluation for SourceFuse

Decision brief. Evaluates every AI code-review option available to us — our in-house Bitbucket Actions, Anthropic's Claude Code Action, and GitHub Copilot code review — and recommends what to run day-to-day. Written for engineering leads and engineers who will live with the tool. Audience: SF engineers + client tech leads. Author: Ajay Gupta. Date: 2026-04-20. Status: Draft for review.

Executive summary

Recommendation: keep our in-PR Review Actions as the only code-default reviewer, and upgrade the model rather than the platform when a repo needs frontier-model quality. Our Bitbucket Actions already run Claude Sonnet 4.6 on every PR, post inline comments, and cost ~$0.05–$0.15 per review. Anthropic's Claude Code Action (GA) is the same Claude behind a heavier GitHub-native control plane (agent SDK, MCP, sandboxed runners) — it earns its keep only for **deep, on-demand, multi-file investigation** (`@claude` in comments, scheduled runs, or pre-merge gates). **Copilot code review is not a fit** — it is shallow, GitHub-only, and has no Bitbucket support.

Option	Monthly cost (10 devs)	Setup effort	Catches	Fits our stack today
Our in-PR Review Actions	**$50**	**Already live**	**Bugs + security** (OWASP, CWE)	**Yes — default reviewer**
Anthropic Claude Code Action (GA)	$50–$150	30 min	Same as above, but can also investigate, run tests, open fix PRs	Yes — for deep / on-demand runs
CodeRabbit (Bugbot-like inside code action)	$0	10 min	Bugs + security + style	Yes — for deep / on-demand runs
Anthropic Claude code review (GA)	$0	10 min	Bugs + security + style	Yes — for deep / on-demand runs
GitHub Copilot code review (GA)	$0	**undisclosed** — seat + 4 months + Actions minutes	Bugs + security + style	No — GitHub only

The three findings that matter most:

1. **We do reviews on the wrong tool.** Bitbucket's active "Actions and pipelines" support — the managed service always tracks Anthropic's current Claude. Hanging "Custom" between Bitbucket Actions and Bitbucket Pipelines is a misnomer — both are custom; the real split is *managed* vs *self-maintained*. Our Bitbucket Actions are the self-maintained kind, and they're the ones we should retire.
2. **Copilot code review is not a fit.** GitHub-only, shallow, and has no Bitbucket support. Its GA status and "4 months + Actions minutes" pricing are also undisclosed — a procurement risk we don't need.
3. **Anthropic's own GitHub Action is the upgrade path — not a new platform.** Same Claude, same prompts, same cost ballpark. Only worth it when we need agentic depth (multi-file investigation, test execution, auto-fix PRs) or want to run reviews on a schedule.

Recommended next steps:

- **Retire our Bitbucket Actions** and move to Anthropic's Claude Code Action (GA) as the default reviewer. Same Claude, same prompts, same cost ballpark — but Anthropic maintains it, so we stop owning the plumbing.
- **Keep the Claude Code Action (GA) available** for deep, on-demand investigation — `@claude` in comments, scheduled runs, or pre-merge gates. Not for every PR.
- **Do not adopt Copilot code review.** Shallow, GitHub-only, and has no Bitbucket support. Its GA status and "4 months + Actions minutes" pricing are also undisclosed — a procurement risk we don't need.

1. The landscape — seven offerings, three vendors

The question: "why not just use Claude Code?" Claude Code is a terminal assistant; that there is one such product. There are seven, and they are not substitutes for each other.

#	Offering	What it is
1	**Our in-PR Review Action**	Purpose-built review prompt, `claude-sonnet-4-6`, Bitbucket Pipe, ~40 lines of YAML. Runs on every PR. Posts inline comments.
2	**Anthropic Claude code review (GA)**	Same Claude, GitHub-native platform. Code review is one use case; the agent SDK, MCP, and sandboxed runners are for anything.
3	**`code review` / `/ultrareview`** (Claude Code built-in)	Local terminal command. Runs in your checkout, with full repo context.
4	**Managed "Code Review"** (Claude code review)	Anthropic-hosted multi-agent review at $15–$25 per review.
5	**CodeRabbit**	Third-party GitHub/GitLab app. Multi-model, learns your team's conventions.
6	**Cursor Bugbot** (Cursor code review)	Cursor's PR reviewer. Multi-pass, runs in parallel.
7	**GitHub Copilot code review**	Copilot's PR reviewer. Shallow, GitHub-only.

Version pinning. Our Bitbucket Actions pin `claude-sonnet-4-6` explicitly — we control when we move. Anthropic's Claude Code Action (GA) tracks the latest Claude by default — we get upgrades automatically, but we also get surprises. Pin explicitly if you want stability.

Harness engineering. Anthropic and GitHub both publish, as marketing, the idea of a **false positives and findings** post: we do not have. Capture what **suggestion acceptance rate matters** that we genuinely better than our

1. The landscape — seven offerings, three vendors

7	**GitHub Copilot code review**	Copilot's PR reviewer. Shallow, GitHub-only.

```
// Pseudo-code: this isn't shipped with a flag, but
// a wrapper around the Agent SDK could look like:
// - Reviewer-type: security | perf | style
// - Scope: changed files | whole repo
// - Output: PR comment | issue | Slack

// Run an agent in a fresh, read-only checkout
// Give it the Bitbucket MCP server (read PRs, post comments)
// Only allow comments — don't let it push code or merge.
```

The review is here is not a replacement for `/ultrareview` — it's a complement. Run `/ultrareview` before you open a PR, and let the Bitbucket Action handle the routine pass.

Why this matters. The Agent SDK is the same harness that powers Claude Code, Cursor, and Bugbot. Once you've built one agent on it, you've built the scaffolding for a dozen more: a security-only reviewer, a dependency-upgrade bot, a test-writer that opens PRs, a nightly repo-health report. Code review is the first one we've shipped, not the last one we can build.

Harness engineering. Anthropic and GitHub both publish, as marketing, the idea of a **false positives and findings** post: we do not have. Capture what **suggestion acceptance rate matters** that we genuinely better than our

2. Head-to-head matrix

Legend: ✅ built-in · ⚙️ configurable / via workaround · ❌ not available. Columns: **Ours** (Bitbucket Actions) · **Claude** (Claude code review) · **Cursor** (Bugbot) · **Managed** (managed "Code Review") · **CodeRabbit** (CodeRabbit).
